An Unhealthy Truth: Rising Rates of Chronic Disease and the Future of Health in America

Six Unhealthy Truths Tell the Story of the Rise of Chronic Disease and Its Impact on Health and Health Care in the U.S.

1. Truth #1: Chronic diseases are the #1 cause of death and disability in the U.S.

   133 million Americans, representing 45% of the total population, have at least one chronic disease.

   Chronic diseases kill more than 1.7 million Americans per year and are responsible for 7 of 10 deaths in the U.S.

   “The United States cannot effectively address escalating health care costs without addressing the problem of chronic diseases.”
   -- Centers for Disease Control and Prevention

2. Truth #2: Chronic diseases account for 75% of the nation’s health care spending

   During 2005, the U.S. spent almost $2 trillion on health care.

   Of every dollar spent...

   ... 75 cents went towards treating chronic disease

   In public programs, treatment of chronic diseases constitute an even higher portion of spending:

   More than 96 cents in Medicare ... ... and 83 cents in Medicaid
Truth #3: Two-thirds of the increase in health care spending is due to increased prevalence of treated chronic disease

Level of health spending among the noninstitutionalized U.S. population, 1987–2000
(in billions of nominal dollars)

- $313.5
- $627.9
- $211 billion

'87   '88   '89   '90   '91   '92   '93   '94   '95   '96   '97   '98   '99   '00

Years

= Increase attributable to rise in prevalence of treated chronic disease

Truth #4: The doubling of obesity between 1987 and today accounts for nearly 30% of the rise in health care spending

Percent of U.S. Adults Who are Obese*
1985

*BMI ≥30, or ~30 lbs overweight for 5’ 4” person

Percent of U.S. Adults Who are Obese*
1985

The percent of children and youth who are overweight has tripled since 1980

If the prevalence of obesity was the same today as 1987, health care spending in the US would be 10 percent lower per person—about $200 billion less
Truth #5: The vast majority of cases of chronic disease could be better prevented or managed

The Centers for Disease Control and Prevention (CDC) estimates...
- 80% of heart disease and stroke
- 80% of type 2 diabetes
- 40% of cancer

...could be prevented if only Americans were to do three things:
- Stop smoking
- Start eating healthy
- Get in shape

Management of chronic disease could also be significantly improved: Chronically ill patients receive only 56% of the clinically recommended preventive health care services.

Truth #6: Many Americans are unaware of the extent to which chronic disease harms their health — and their wallets

National survey conducted in April 2007 on Americans’ views of chronic disease and its impact on health and spending

<table>

</tbody>
</table>

Only a small fraction of Americans, less than one in six, comprehend the magnitude of the problem: That chronic diseases represent more than 70% of the deaths in the U.S. and more than 70% of health care costs.
